

ASTRAIOS QUANT PLATFORM

Markets, made legible.

An ML platform for retail and semi-pro traders. Ranked signals with confidence scores, and a paper-first auto-trading API with the same engine behind it.

COMPANY

Astraios

STAGE

Pre-seed · Private beta

COVERAGE

US equities · Crypto

SINCE

MMXXVI

02. PROBLEM ———

Retail traders are drowning in data and starved of signal.

Brokerages give customers a feed, not an edge. Bloomberg-grade intelligence is priced for institutions. Alpha-generation tools aimed at retail are either black-box auto-traders with no explainability, or indicator soup with no execution path.

- No single surface ranks trades by confidence and reasoning.
- No paper-first path from signal to live capital.
- No API that a developer or small fund can actually build on.

One engine, two surfaces.

A shared strategy engine reads market microstructure, macro regime, and filings data. The consumer app renders it as ranked trades with confidence scores and explanations. The API exposes the same signals to developers, routed through Alpaca paper accounts by default.

CONSUMER APP Read the trade before taking it. Ranked signals, confidence scores, and an explanation of why each call was surfaced — so users build trust in the model, not blind faith.	TRADING API Paper-first auto-execution. REST for strategy state, WebSocket for live signals. Paper accounts by default, live routing opt-in, kill switch per account.
--	--

Four layers from raw ticks to routed order.

01 Data Layer Polygon and CCXT for prices, FRED for macro, SEC EDGAR for filings — normalised into TimescaleDB, streamed over Kafka.	02 Model Layer HMM + LSTM ensembles for regime detection, Temporal Fusion Transformers for multi-horizon forecasts, PPO/SAC for portfolios.	03 Strategy Engine Signal generation with confidence scores, fractional Kelly position sizing, VectorBT for thousands of sweeps per minute.	04 Execution Layer Alpaca paper accounts by default. Live routing opt-in, Redis-queued between strategy and orders, end-to-end logged.
---	--	--	---

05. WHY NOW ———

Three windows just opened at the same time.

- **Retail is durable.** Millions of self-directed accounts stayed after the 2020–2024 wave; brokerage tooling has not caught up.
- **Models got cheap.** TFTs, open-weight LLMs, and GPU rental make research-grade inference runnable on a single node.
- **APIs are plumbed.** Alpaca, CCXT, and Polygon mean a pre-seed team can ship a real execution loop in weeks, not quarters.

A stack of three audiences, one engine.

~\$6B RETAIL TOOLING Addressable spend on alpha, analytics, and copy-trading across brokerage users.	~\$3B DEVELOPER API Quant-as-a-service, signal APIs, and small-fund infrastructure.	\$20–40B ADJACENT FINTECH Risk tooling, portfolio analytics, research platforms we expand into.	30d PAPER-FIRST GATE Every strategy paper-trades for 30 days before any live account is eligible.
---	--	--	--

We enter through the first bucket and compound into the second. Retail is a top-of-funnel for developer and fund users — the same engine, priced differently.

From raw ticks to live capital, in four disciplined moves.

01 INGEST One store of truth for prices, macro, and filings. Training, backtests, and inference all read from it.	02 MODEL Baseline first. Ensembles and RL only earn their way in once they fairly beat the simpler model.	03 BACKTEST Strict time splits, survivorship-adjusted universes, and look-ahead checks before paper trading opens.	04 DEPLOY Thirty days paper, ONNX inference path, and a per-account kill switch wired in from day one.
--	--	---	---

Subscription for humans, usage for code.

A Consumer Free tier: delayed signals on paper. Paid tier (\$19–49/mo) unlocks real-time ranked trades, explanations, and live-trade hand-off.	B Developer API Metered per call and per live account. Paper is free; live routing bills per-execution plus a small AUM-linked take.	C Data Flywheel Every accept/reject, hold time, and override is a training label. The data we own, not the model we run, becomes the moat.
---	---	---

09. MOAT & TEAM —————

A two-person team inside the live trading loop.

One owns the models and feature store; the other owns the consumer surface and the API. The data flywheel compounds from day one — every interaction is a training label we keep.

- **Amyanshu — Systems & Research.** Regime detection, forecasting, and the feature store that keeps training and inference honest.
- **Swetagni — Product & Platform.** Consumer surface and the trading API. Turns model output into interfaces users trust and hand capital to.
- **Distribution.** Developer API reuses the same engine, widening the top of funnel without a second product.

Twelve months to a priced Series A.

Q2 MMXXVI Private Beta Consumer app on paper only. First 500 users. Feature store, baseline models, VectorBT harness live.	Q3 MMXXVI Live Hand-off Opt-in live routing to user-owned Alpaca accounts. Kill switch, telemetry, subscription billing.	Q4 MMXXVI API GA Public developer API. Paper-first onboarding. First design partners on live metered execution.	Q1 MMXXVII Series A Paid cohort, API revenue, 90-day live paper/real parity report. Priced round on real metrics.
---	---	--	--

LET'S TALK

Signal worth capital.

We are onboarding a small group of traders and developers onto paper accounts first. If you want a seat — or an API key for the execution layer — start the conversation here.

- **\$1.5M pre-seed ask.** 18-month runway. SAFE preferred.
- **Use of funds 60 / 30 / 10.** Research & infra · GTM & design partners · Legal and data.
- **Next round Q1 MMXXVII.** Priced Series A against live-trade parity and API revenue.
